
The issue is a compatibility mismatch between your Python version (3.13) and the specific version of Pillow (10.1.0) listed in the requirements.txt.

The Problem

You are running Python 3.13 (visible in your error path: .../lib/python3.13/...). However, Pillow 10.1.0 is an older version that does not have pre-built support (binary wheels) for Python 3.13. When pip tries to build it from source code, it fails because the old Pillow build script isn't compatible with the new Python 3.13 build tools.

The Solution

You need to upgrade the requested version of Pillow to one that supports Python 3.13.

Option 1: Quick Fix (Update requirements)

Open requirements.txt and change the line `Pillow==10.1.0` to simply `Pillow`. This will allow pip to download the latest version (which works on your system).

You can do this quickly from your terminal with this command:

Bash

This replaces the strict version with a generic request for the latest Pillow

```
sed -i 's/Pillow==10.1.0/Pillow/' requirements.txt
```

Now run the install again

```
pip install -r requirements.txt
```

Option 2: Manual Edit

If you prefer to edit the file manually:

Open requirements.txt in a text editor (e.g., nano requirements.txt).

Change Pillow==10.1.0 to Pillow>=11.0.0 (Pillow 11.0 officially supports Python 3.13).

Save and exit.

Run pip install -r requirements.txt again.
